

# **WATER AND SEWERAGE ADMINISTRATION BENCHMARKING SYSTEMS AND EU AND DANISH REGULATIONS**

*CARL-EMIL LARSEN, CHIEF EXECUTIVE, DANVA*

# DANVA

## Danish Water and Wastewater Association

- ✓ Trade organization for Danish Watercompanies
- ✓ Board of Management include politicians and chief executives
- ✓ Appr. 100 companies with voting rights.
- ✓ Member companies are giving service to more than 5 million Danes
- ✓ Number of staff is 35. Appr. 300 colleagues from member companies organised in network and projectgroups
- ✓ Entitled to attend public hearings and consultations
- ✓ EurEau – the European Federation of national water associations
- ✓ Members service, representation of interest, training, communication of best practice, standardisation and projects

# Danish watersector

- Inhabitants: 5.806.081 (2019K1)
- Annual extraction by the waterworks: 373.000.000 m<sup>3</sup> (decreasing)
- Number of waterworks: 2.400
- 100% groundwater, simply treated, no chlorine added
- Number of wastewater treatments plants: 786
- Annual treatment of waste water: 697.000.000 m<sup>3</sup>
- Annual turnover watersupply: 1 billion euro
- Total annual turnover waterservices: 3 billion euro
- 100 % public owned (35 % of waterworks (volume) are cooperatives)
- Operation & maintenance 50 % public
- Construction work 15 % public

# DANVA BENCHMARKING

# Benchmarking in Denmark - 1918

## Danish Statistics from 1918

Drinking water – eg.:

- Number of inhabitants
- Number of houses with water
- Abstracted groundwater
- Average daily consumption – l/person
- Number of toilets

- 6 -

# DANVA Benchmarking

## 1998:

- EU regulation on electricity started and Danish energy utilities did the first pilot on benchmarking
- 8 DANVA members started a project on benchmarking

## 2003:

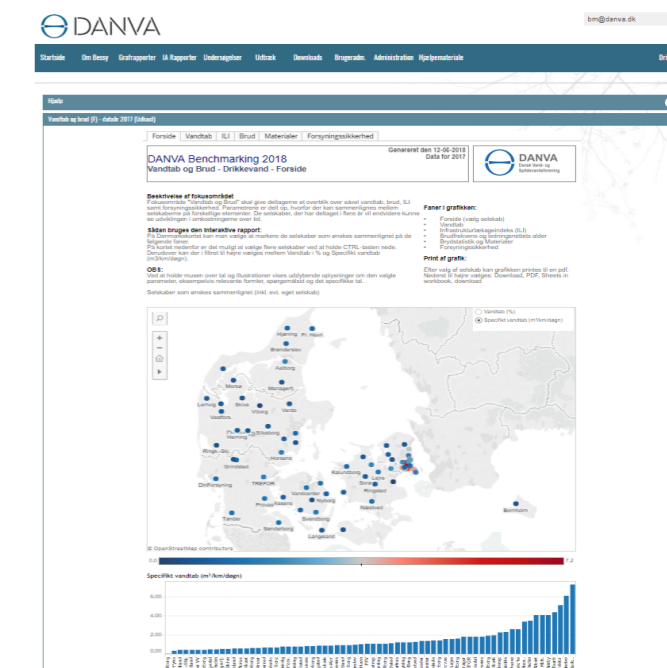

- DANVA Benchmarking on drinking water and waste water 2. pilot based on data from 2001 – excel

## 2004:

- BESSY I: First portal and related database for DANVA benchmarking
- Cooperation among nordic and dutch association on benchmarking

## 2009:

- BESSY II: Improved portal with new functionalities as automatic reporting and flexible surveys.

# Benchmarking for water companies

## Reporting to Secretariat for water supply (2010):

- Economic regulation
- TOTEX Benchmarking => Efficiency requirement  
(Economy)

## Reporting to Danish Environmental Agency (2018):

- Performance benchmarking – mandatory from 2018  
(Environmental parameters)  
(Energy consumption/production)  
(CO<sub>2</sub> footprint)

## Reporting to DANVA Benchmarking (2004):

- Danva Benchmarking  
(Economy, environmental and much more)

## Velkommen Thomas

BESSY kan du indtaste oplysninger til DANVAs benchmarking og Vandstatistik og deltage i undersøgelser.

Derudover kan du lave grafrapporter, udtrække data til egne analyser eller finde rapporter fra DANVA.

Log ind i indlogningsfeltet øverst til højre.

[Læs mere om DANVA Benchmarking her](#)

## Nyheder

Fredag den 8/6-2018

Nye benchlearningforløb tilbydes

Onsdag den 6/6-2018

Tidsfrister for indberetning af performancebenchmarkingdata

Torsdag den 31/5-2018

Funktionen 'Vis kun manglende' i indberetningen fungerer ikke

Onsdag den 30/5-2018

Forslag til benchlearningforløb efterlyses

## Dine undersøgelser

# Reports DANVA BM

## Public report:

- Water in figures

## Graph reports:

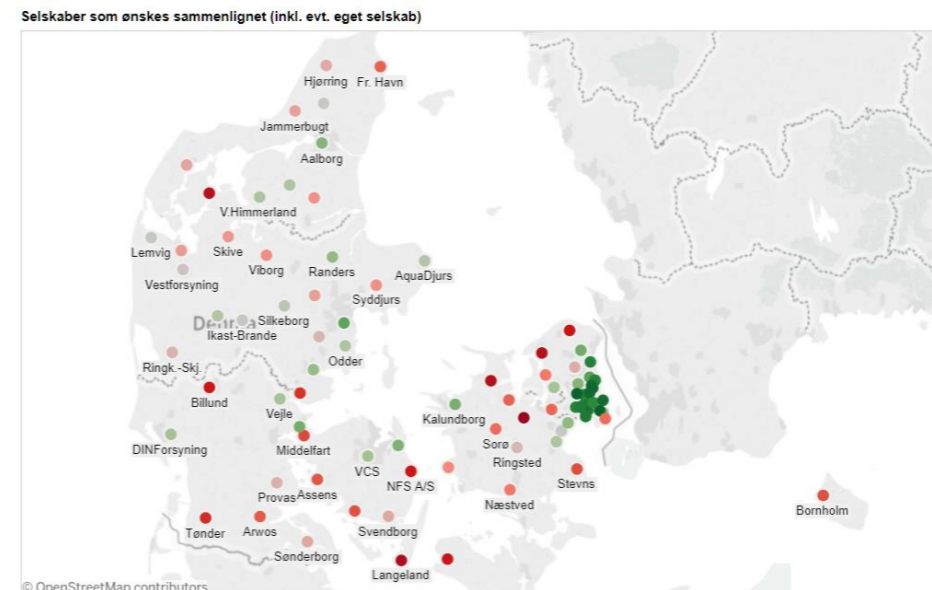

- 100-120 graphs with KPI
- Reading online into database

## Interactive reports for each focus area:

- Report for each focus area – ready online parallel with the reporting period
- Customized by user
- Customized reports can be saved as .pdf
- Reports are generated online and instantly synchronized with the database

## Video-meetings:

- 1 hours video meeting for each report

DANVA - Godthåbsvej 83 - 8660 Skanderborg

# From benchmarking to benchlearning:

Some of our participants had the problem:

*"We used a lot of time getting data into the system but we never get time to use/work with the results!"*

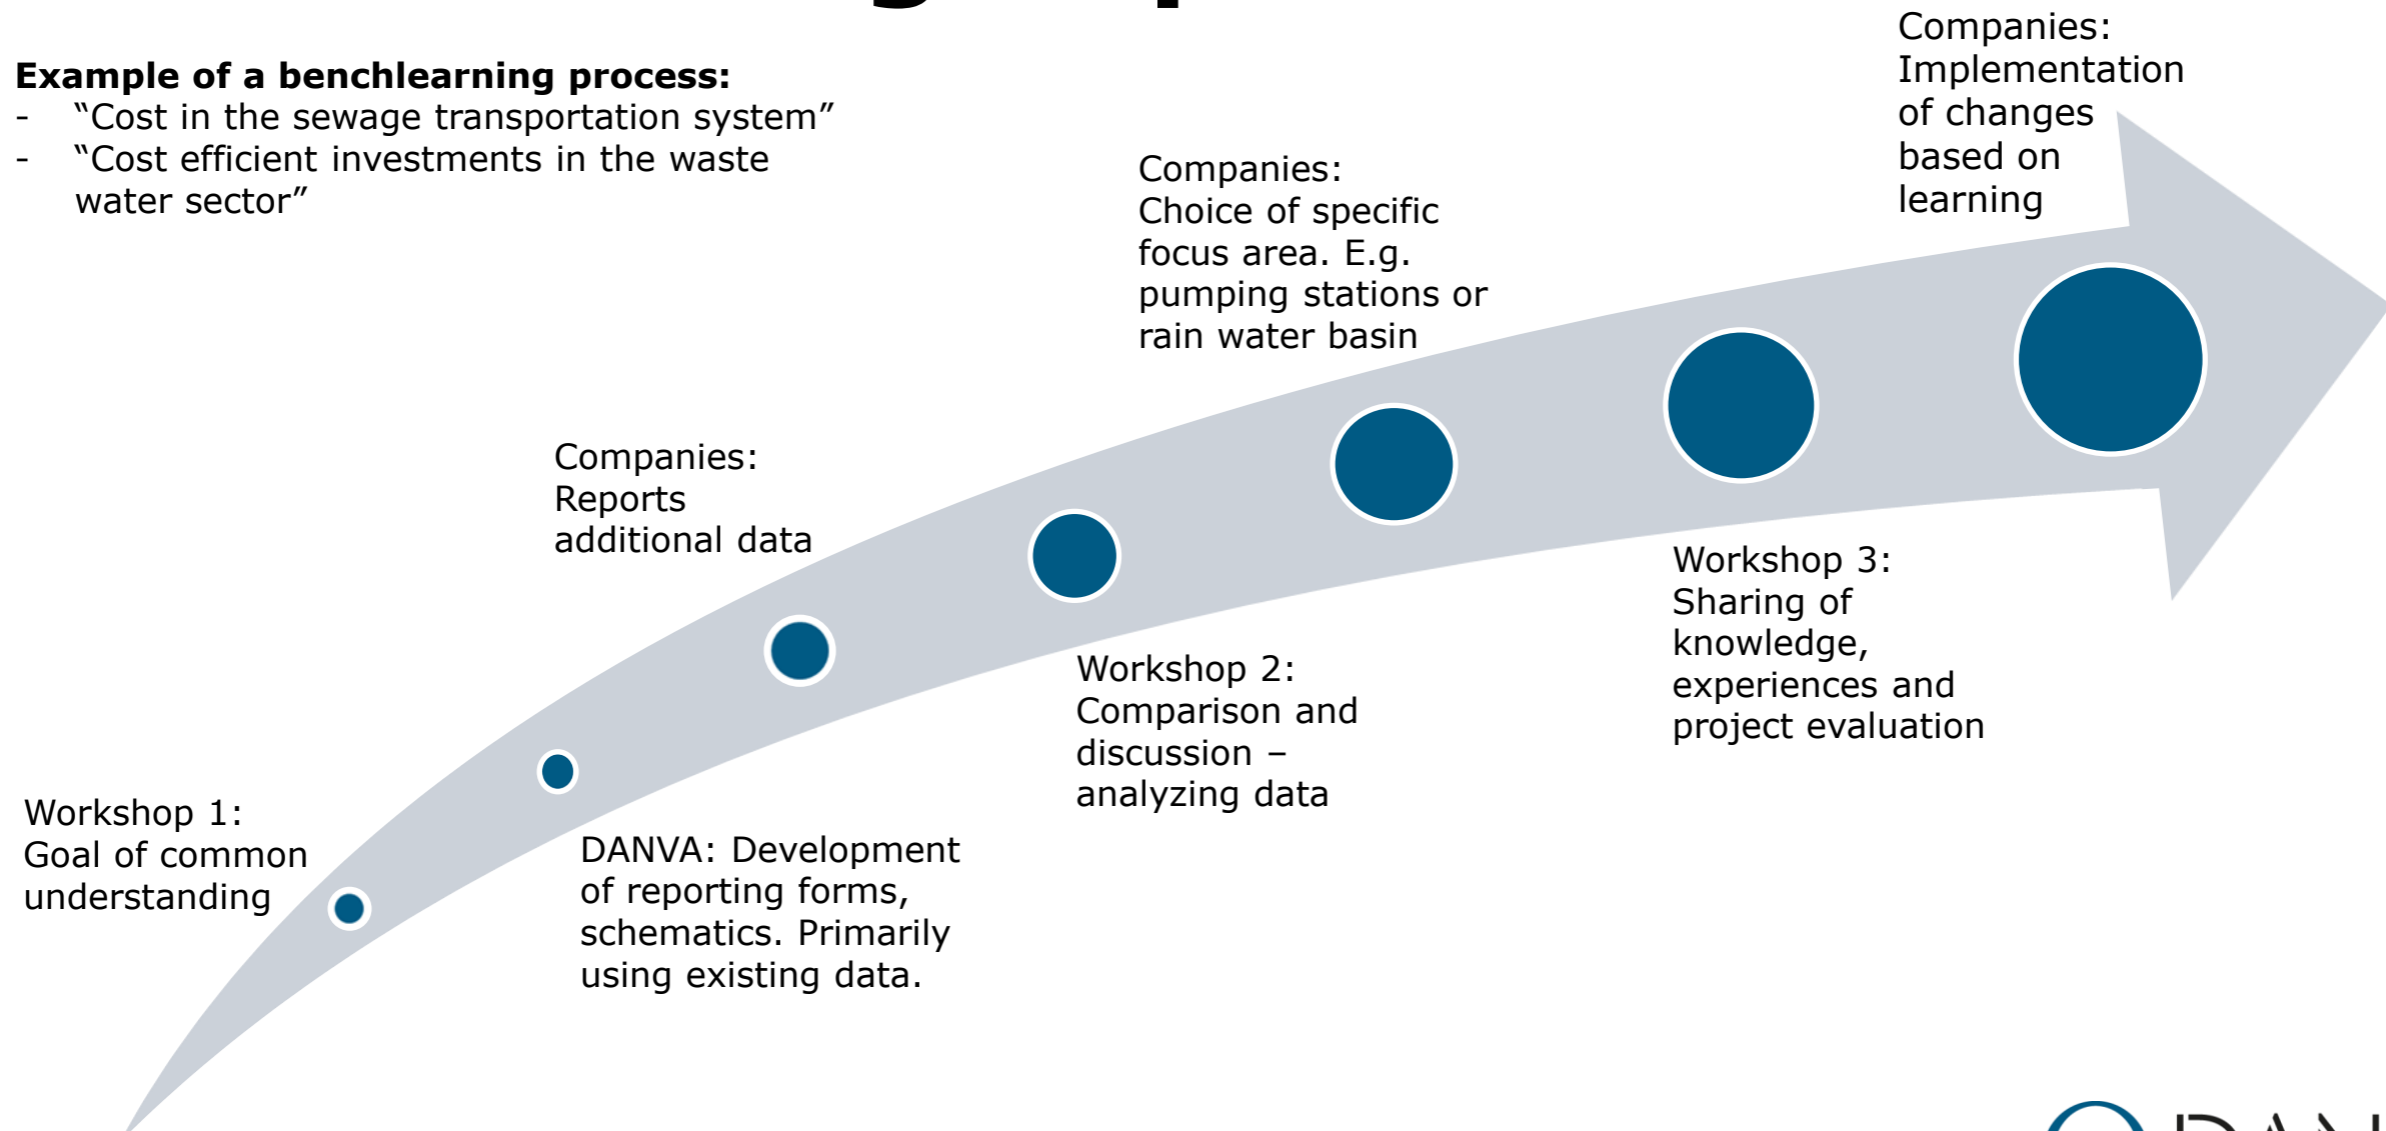

We therefore started offering DANVA **Benchlearning** work-shops:

- We choose one specific subject
- Invite our participant to a process with 2 – 4 workshops
- We talk about experiences, learn of each other, sum up opportunities for improvements, develop new KPIs
- There will be homework for the participants
- Each course is finished with a small experience report, which is distributed to all the other participants.

# Benchlearning in practice

## Example of a benchlearning process:

- "Cost in the sewage transportation system"
- "Cost efficient investments in the waste water sector"

# Optimized timeline

## DANVA Benchmarking - 10 years ago:

## DANVA Benchmarking - 5 years ago:

## DANVA Benchmarking - last year:

 = Preparing the IT-programme with questions

 = Water Companies reporting data

 = Quality check of data

 = Preparing main report

 = Main reports publish

 = Benchlearning

# Consumption of water, 1976 – 2017

CONSUMPTION OF DRINKING WATER, 1976 - 2019

M<sup>3</sup>/PERSON/YEAR

Since 2014, a new category of "holiday homes" has been introduced, which is included among the figures for households.  
 1976–1998: Special project: Modelling of water demand in Denmark by Nana Sofie Aarøe – data from 14–30 companies.  
 1999–2019: Data from DANVA's calculations for "Water in Figures" – data from 33–116 companies.

# Average household expenses for water

Cost for drinking water (blue) and waste water (green)

AVERAGE HOUSEHOLD EXPENSES FOR WATER, 2007 - 2019  
€/M<sup>3</sup> (2019 PRICE)

The estimate is for an average family of 2.15 people with an average consumption per person of 36.88 m<sup>3</sup>/year.

# Annual household living expenses

## A HOUSEHOLD'S ANNUAL LIVING EXPENSES – SELECTED CATEGORIES

Data from [www.statistikbanken.dk/FU51](http://www.statistikbanken.dk/FU51) – data from 2014 and 2015, current prices. The example covers a family with 2 adults, with one or more children living at home, with annual expenditure of DKK 420,950.

# Net and gross energy for treatment

# Operating cost

## OPERATING COSTS, 2010 - 2019

€/ M<sup>3</sup> SOLD WATER (2019 PRICES)

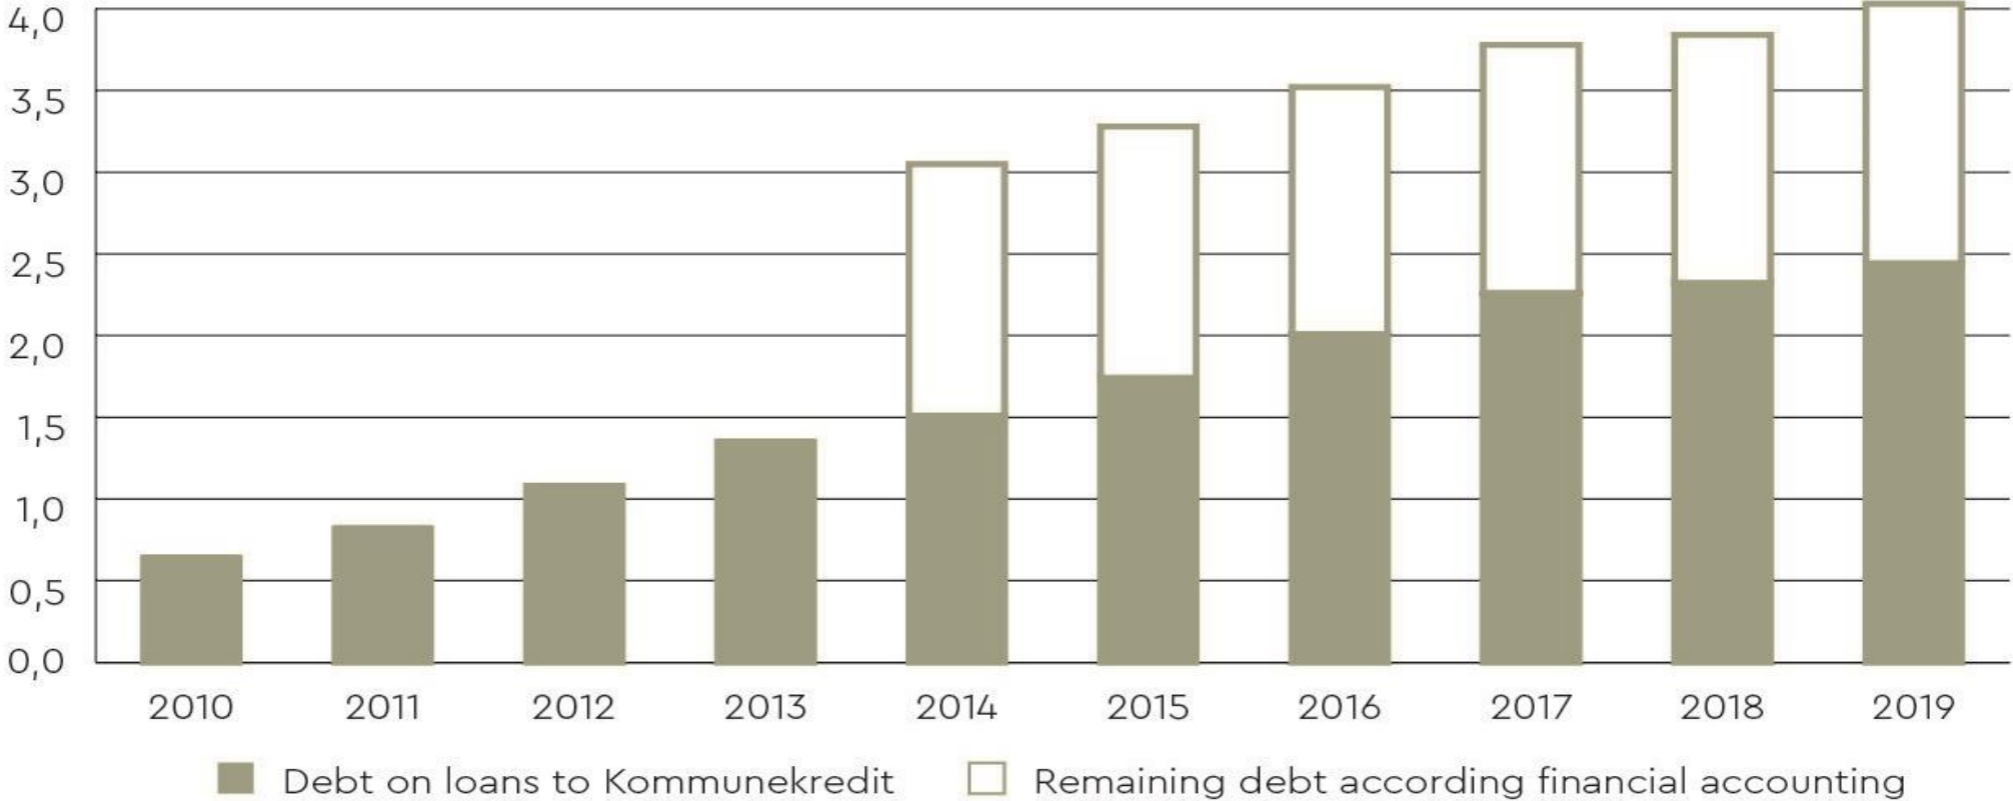

## OPERATING COSTS, 2010 - 2019

€/M<sup>3</sup> SOLD WATER (2019 PRICES)

# Debt on loans to watercompanies

BILLIONS €

# ECONOMIC REGULATION OF THE DANISH WASTE WATER SECTOR

# Cap on prices/revenue

- Price cap – prices not allowed to exceed a given limit (2011-2016)
  - Focus on maintenance and operational expenses
- Revenue cap – revenue not allow to exceed a given limit (2017-?)
  - Focus on total expenses (including capital cost)
- Attention: No cap on expenses
- Loan an opportunity (limited on operational expenses for municipal-owned companies)

# Revenue cap divided into boxes:

Operational and capital cost  
including financial cost

Unavoidable cost

Co-financing climate change  
adaptation

Control (+/-)

# Decreasing cap...

## General cut (yearly)

- 2 % of operational cost in cap
- Variable cut on capital cost in cap depending on productivity in similar sectors (2,8%)

## Individual cut (yearly)

- Up to 2 % of total cap – based on regulatory benchmarking

## Small companies

- 200.000 m<sup>3</sup> – 800.000 m<sup>3</sup> general cut on 1,7 % yearly – no individual cut.

## Total cuts

DKK 2 billion (EUR 270 mio. of appr. 2 billions (13,5%))

# Cost that can lead to increased cap:

- Activities imposed/authorized by municipalities or the state (where they have the legal power to do so)
- Extension of supply area
- Replacement of sewers and pumping stations if cost are imposed by other infrastructure projects
- Periodical operational cost, co-financing climate change adaption, lacking ability to pay off debt, force majeure, other adjustments.

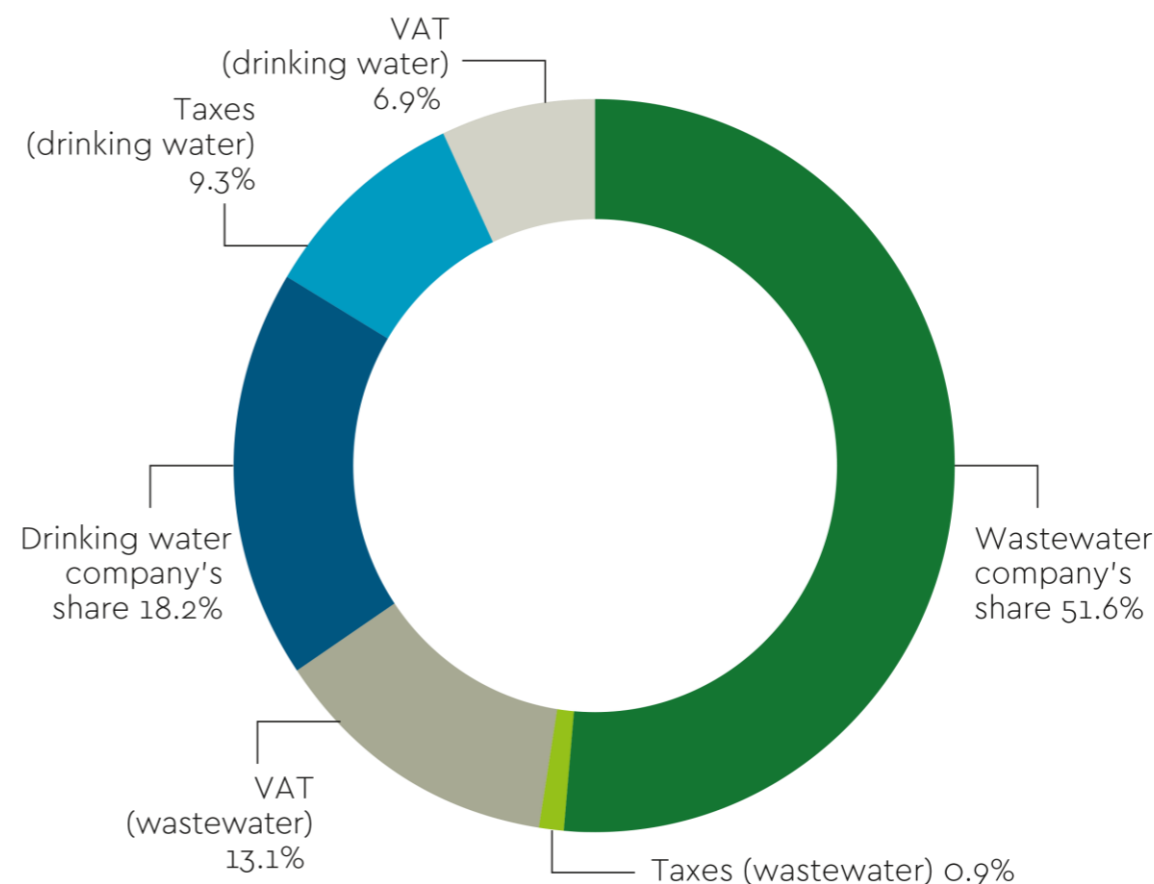

# PRICING IN THE DANISH WATER SECTOR

# Composition of average price

Average price for an average family – 2,15 persons consuming 82,69 m<sup>3</sup> - in 2018: 69 DKK (9 EUR /38 AED)/m<sup>3</sup>

Categories to the right

SHARE OF WATER PRICES BY CATEGORY

# Full cost recovery and polluter pays

- Waste water service customers pay all costs
- E.g.: investments, operational, administrative, environmental, regulatory, VAT and taxes
- No tax grants to the water sector (full cost recovery)

# Payment based on metering

- Mandatory by law that all customers (citizens and public/private enterprises and institutions) have individual drinking water meters on their properties

- Payments are calculated according to prices in DKK multiplied by volume in  $m^3$  of drinking water consumption

- Payment for waste water services is based on drinking water consumption too. Differing volumes of storm water discharge from customers are not reflected in pricing

# Variable and fixed pricing

Drinking water fees		Waste water fees	
Fixed	Variable	Fixed	Variable
<u>Connection fee</u> 25,753 DKK (3,452 EUR) (14,100 AED)	-	<u>Connection fee</u> 51,600 DKK (6,916 EUR) (28,383 AED)	-
<u>Operation fee</u> 680 DKK (91 EUR) (374 AED)	<u>Operation fee</u> 18 DKK/m <sup>3</sup> (2.4 EUR) (10 AED)	<u>Operation fee</u> 467 DKK (63 EUR) (256 AED)	<u>Operation fee</u> 41 DKK/m <sup>3</sup> (5,5 EUR) (22,55 AED)

\* National average fees from 2019

\* VAT included in all fees

\* Corporations pay an additional fee, if they discharge severely polluted waste water

# VAT and environmental taxes

- VAT constitutes 25% on sales of goods and services – including the ones in the water and waste water sector
- Waste water is also taxed with an environmental tax: 0.65 DKK (0.35 AED) per m<sup>3</sup> waste water discharged from a waste water treatment plant
- The tax is levied on remaining substance loads of Nitrogen, Phosphorous and organic material and incentivises plants to more substance removal

\* VAT included in the tax

# WATER LOSSES IN DENMARK

# Water losses in Denmark

- Denmark have a very low level of water loss in the distribution system.
- In 1996 a penalty was introduced for water losses above 10 %.
- A law from 1996 demands metering of all evacuated and billed water, which gives very solid data.
- On-line metering is improving the data further and developed fast from 15 % of all meters in 2013 to 46% in 2017.

NON-REVENUE WATER (WATER LOSS), 2011 - 2019

Average (%) based on 50-52 drinking water companies which have participated in DANVA benchmarking over the past 9 years.

# Waterloss in the distribution system

NON-REVENUE WATER (WATER LOSS), 2016

**NOTE:** The registration has not taken into account any post-adjustments of the company's water losses which could be due to a contamination/pollution process with large flushings of the pipeline network, where an exemption has been granted for the water used in relation to the calculation of penalty charges. This means that there may be minor differences in the water loss stated in the graph and the water losses declared by the companies themselves.

# Water losses

## Types of calculation methods:

### Non-revenue Water:

- Water loss; %
- Specific Water loss; m<sup>3</sup>/km/day

### Real losses:

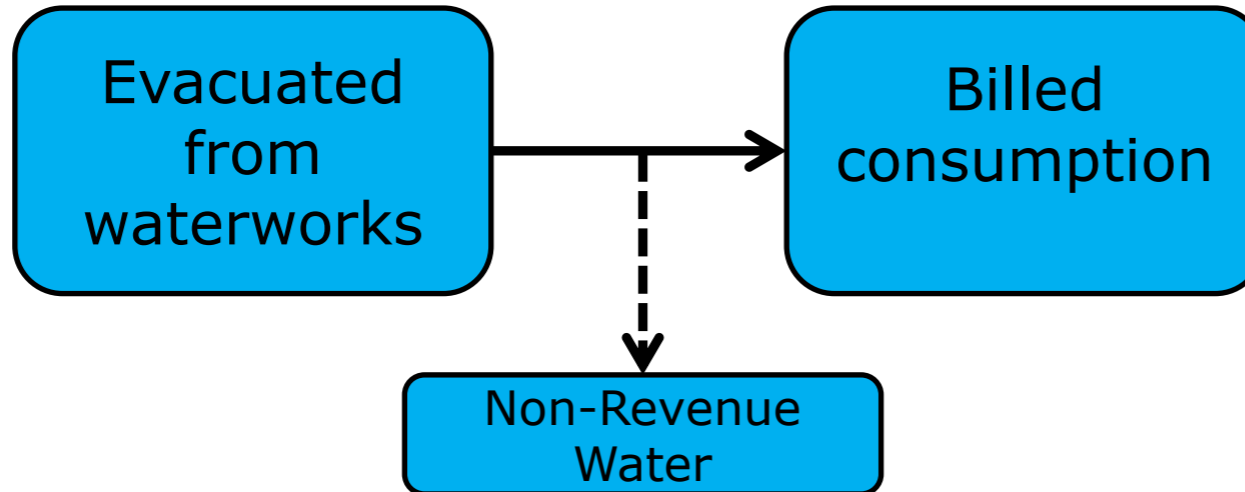

- Infrastructure Leakage Index (ILI)

# IWA Waterbalance

System Input Volume	Authorised Consumption	Billed Authorised Consumption	Billed Metered Consumption (including water exported)	Revenue Water		
			Billed Unmetered Consumption			
		Unbilled Authorised Consumption	Unbilled Metered Consumption	Non- Revenue Water (NRW)		
			Unbilled Unmetered Consumption			
	Water Losses	Apparent* Losses	Unauthorised Consumption		Water loss	
			Metering Inaccuracies			
		Real* Losses	Leakage on Transmission and/or Distribution Mains			Specific Water loss
			Leakage and Overflows at Utility's Storage Tanks			
Leakage on Service Connections up to the measurement point	ILI					

# Non-revenue Water

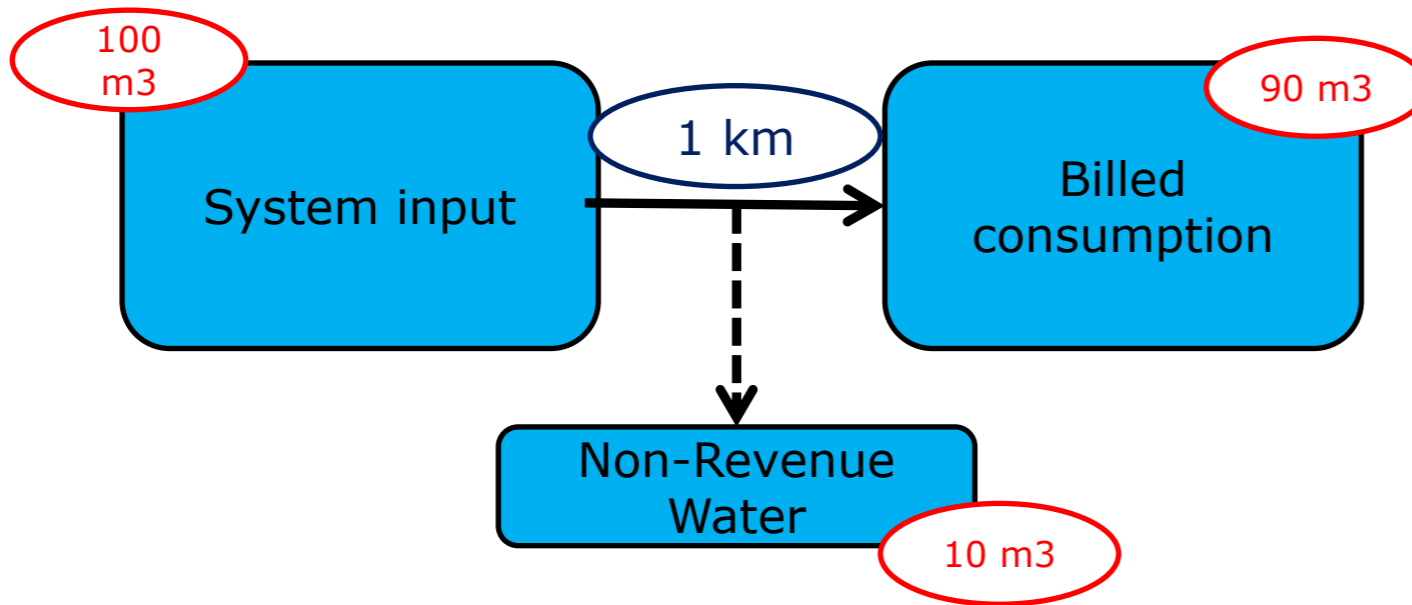

## Non-Revenue Water:

- **Unbilled authorised consumption:**
  - flush recently repaired pipelines and to extinguish fires
- **Apparent losses:**
  - Unauthorised consumption, metering inaccuracies
- **Real losses:**
  - Leakage into underground

# The difference between % and m3/km/day

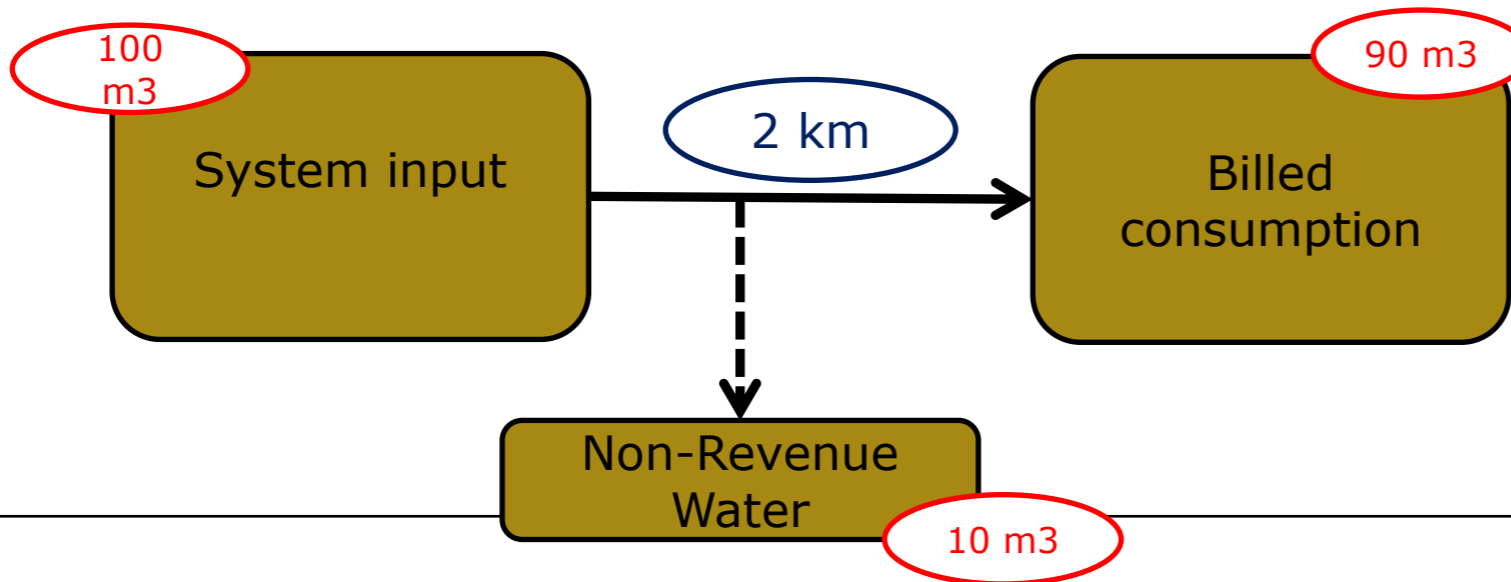

Company 1:

$$\frac{10 \text{ m3}}{100 \text{ m3}} = 10\%$$

$$\frac{10 \text{ m3}}{1 \text{ km} * 365} = 0,028 \frac{\text{m3}}{\text{km} * \text{døgn}}$$

Company 2:

$$\frac{10 \text{ m3}}{100 \text{ m3}} = 10\%$$

$$\frac{10 \text{ m3}}{2 \text{ km} * 365} = 0,014 \frac{\text{m3}}{\text{km} * \text{døgn}}$$

# The difference between % and m3/km/day

Big water companies normally best like waterloss i % .

Smaller water companies normally best like waterloss i m3/km/day.

Aarhus, the second largest city in Denmark, normally prefer NRW in % on graphs.

# Infrastructure Leakage Index (ILI)

- ILI is an international water loss performance indicator developed by the International Water Association (IWA) that makes it possible to compare current real (physical) water loss and “unavoidable” real water loss as it occurs within various drinking water companies with different key characteristics, as well as between countries.
- ILI compares data on current real water loss (CARL) with the “unavoidable” real water loss (UARL).
- Infrastructure leakage index (ILI) =  $CARL/UARL$
- The index should be as close to 1 as possible.

# Current real water loss

Current real water loss (CARL) is the difference between sold water volume plus abstracted groundwater, minus estimated water used to flush recently repaired pipelines and to extinguish fires as well as any other authorised unbilled use, illegal use and metering inaccuracies.

# Unavoidable real waterloss

Unavoidable" real water loss uses international equations applicable to well maintained operationally sound networks of different sizes with different water pressures to calculate minimum technically achievable real water loss.

$$\text{UARL: } (18 \times \text{LM} + 0.8 \times \text{Nc} + 25 \times \text{Lp}) \times \text{P} \quad \text{l/day}$$

Where:

- LM= total mains length
- Nc= Underground service connections, main to first meter
- Lp= Length of service connection in km + private service connection length in km
- P= average pressure (in meters head)

## Identify sources of water loss

Danish water utilities are among the best in the world at limiting water loss. Learn about the technologies and methods they use to monitor the pipeline grid, plan pipeline repairs, and identify and repair leaks quickly.

Denmark has implemented systematic measures to reduce the loss of drinking water as it makes its way from waterworks to the consumer. Danish drinking water providers are actually among the best in the world in this area.

[Water loss is a waste of resources](#)

### What is water loss?

This website defines water loss as the amount of distributed drinking water that does not reach customers, and that water utilities therefore do not receive payment for. This is also known as Non-Revenue Water (NRW). NRW covers:

- the amount of water lost due to e.g. ruptures and leaks in the pipeline grid and reservoir overflows (also known as physical losses)
- unauthorised consumption, such as illegal tapping and meter inaccuracies (also known as apparent losses)
- authorised consumption used to flush pipes at new installations and during repairs, water used for fire fighting and sprinkler systems checks, etc. (also known as unbilled authorised consumption)

Water loss is often either calculated as the percentage of total
